odine

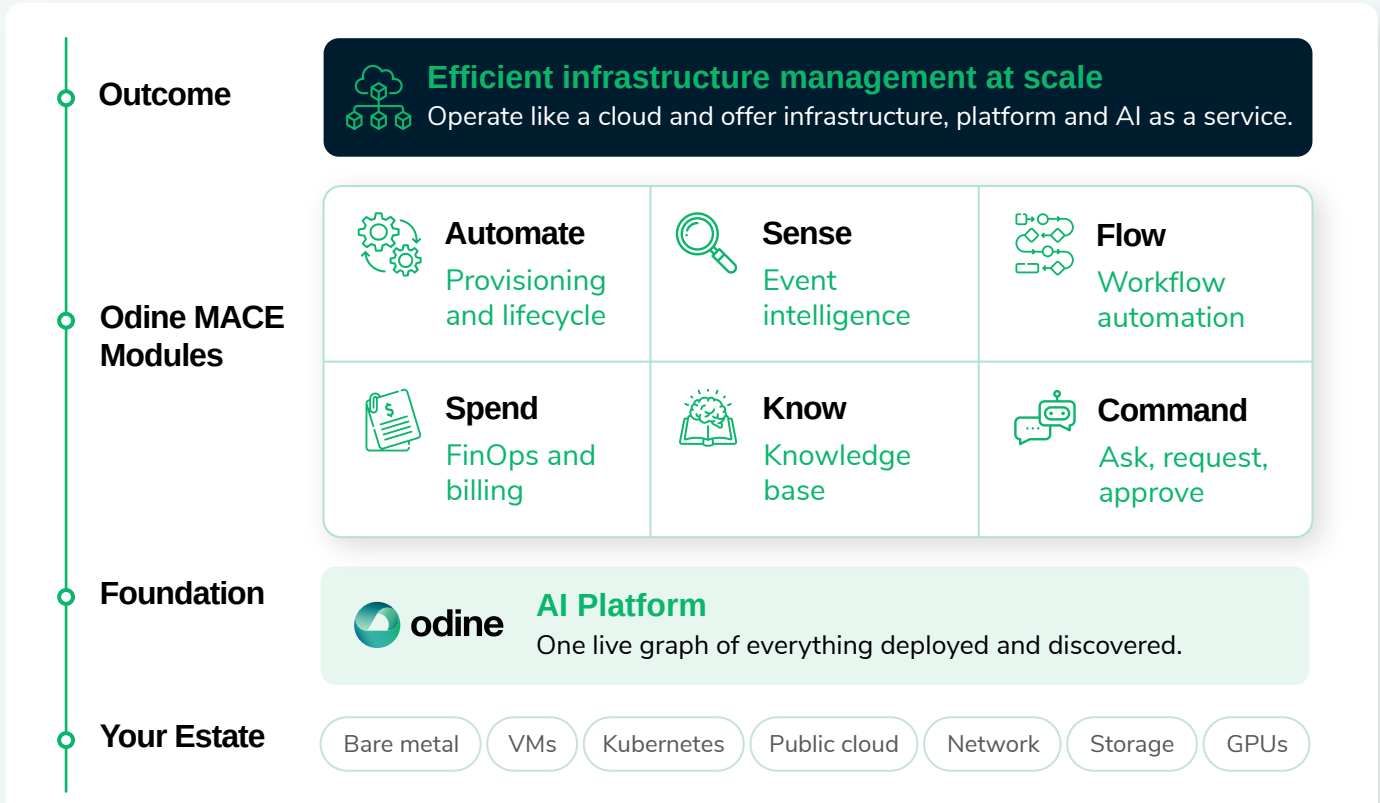

ODINE MACE

Agentic Multi-Cloud Management

- Faster time-to-market for AI Cloud services.
- Unify private cloud and AI infrastructure operations.
- Resolve incidents with cross-layer intelligence.
- Automate safely with governed AI agents.

One unified platform to manage private cloud, AI infrastructure and deliver AI cloud services

Odine MACE unifies what it takes to deploy, run and deliver private cloud and sovereign AI infrastructure to internal and external customers. Built on a live operational model, Odine MACE combines automation, event intelligence and governed AI agents to turn operational intent into policy-controlled actions with human oversight.

Features and Benefits

Start monetizing AI Cloud in 5 days
Deliver Model-as-a-Service, GPU-as-a-Service and AI workbenches through AI Cloud Portal with customer isolation and token based billing.

Offer self-service without losing control
Teams provision in minutes through a governed portal, so services launch on time and engineers focus on improvements.

Speed up infrastructure and GPU provisioning
One control plane provisions bare metal, VMs, containers, networks and GPUs across hybrid and multi-cloud.

Resolve incidents faster
Cross-layer correlation turns alarm storms into asingle incident with root cause and blast radius.

Fix recurring issues automatically, safely
AI agents resolve known issues around the clock, acting only through the workflows and policies you approve.

Automate ITSM procedures
Map existing procedures to predefined workflows, triggered by people, alarms or tickets.

Stay compliant by design
Policy and data residency are enforced at provisioning, before any change goes live.

Lower total cost with tool consolidation
Usage metering, chargeback and reclaimed idle resources on one platform that replaces single-purpose tools.

Make every operator productive
Plain-language requests and a searchable knowledge base of incidents, runbooks and guides.

Modules

MACE Automate: provisions and changes bare metal, GPUs, storage, virtualization, Kubernetes and network on any platform, with VM and container mobility across clouds and a self-service portal within set limits.

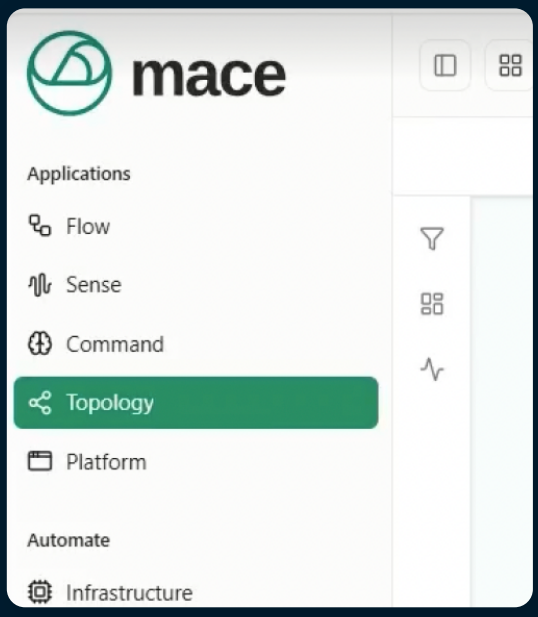

MACE Sense: monitors the full infrastructure, reduces alarms to root cause and impact, and resolves common disk, CPU, memory, network and capacity issues with AI agents, alongside your existing monitoring.

MACE Flow: turns manual procedures into workflow striggered by people, alarms or tickets, and limits AI agents to approved workflows.

MACE Spend: tracks cost, usage and waste such as idle GPUs, and handles chargeback, customer billing and portal billing.

MACE Know: turns documents and past incidents into answers anyone on the team can query.

MACE Command: a single plain-language interface to ask questions, make requests and approve actions.

Built for secure, regulated environments

Odine MACE is designed to operate inside security-sensitive and regulated environments. Core controls include role-based access control with per-tenant scoping, a unified audit trail across every environment, encryption of data in transit and at rest, secrets management for stored credentials, and configurable authentication. The platform supports sovereign deployments with no mandatory external dependency.

Odine MACE is a suite that unifies the capabilities required to deploy, run and deliver hybrid-cloud, network and AI infrastructure through automation, event intelligence, governance and self-service consumption. Built on the AI Platform™, a single live model of everything deployed and discovered, its modules provision resources across any platform, correlate events into root cause, enforce policy before changes go live, and expose infrastructure, platform and AI as a service with full cost visibility.

AI agents work only through workflows you approve, and teams interact with Odine MACE in plain language. As infrastructure grows in scale and complexity, Odine MACE helps you operate it like a cloud: faster delivery, fewer incidents, lower cost and full control over every automated action.

What Changes with Odine MACE

For infrastructure teams

- Spend less time on tickets and more on improvements
- Grow the estate without growing the team
- Keep services running when people move on
- Pass audits without manual evidence gathering

For service providers

- Launch an AI cloud offer on capacity you already own
- Onboard new customers without custom builds
- Bill every tenant accurately from day one
- Deliver the same service quality to every customer

Build with control.

Operate with confidence.

See how Odine MACE unifies operations across cloud, network and AI infrastructure while preserving sovereignty, governance and control.
